

PROJECT ASTRA

Project Astra Pilot

Timeframe: late-2021 to 2022

Description

The Project Astra pilot will run in 2021 and 2022, during which the data from the mesh network will be used by operators to inform methane reduction programs.

Throughout the pilot, the data from the mesh will be compared against other, proven methane detection technologies to assess accuracy, efficacy, and comparability to other solutions.

Outcome

Outputs from the pilot support accelerated and enhanced emissions reductions by project participants; inform a cycle of continuous improvement in the mesh network design; and potentially enable a pathway to alternative compliance approval for the system.
